2. Requirement Analysis

2.1 Functional Requirements

The system shall provide the following functional capabilities.

FR-01: Incident Creation

The system shall allow Service Desk agents to create incidents from the Service Operations Workspace.

The incident should capture information such as:

- Caller
- Short description
- Description
- Assignment group
- Service
- Service offering
- Configuration item
- Category
- Subcategory
- Impact
- Urgency
- Work notes
- Incident state

FR-02: Incident Classification

The system shall allow agents to classify incidents using appropriate categories and subcategories.

For the project scenario:

- **Category:** Network
- **Subcategory:** VPN
- **Urgency:** 2 - Medium
- **Service:** Remote Access
- **Service Offering:** Corporate VPN
- **Configuration Item:** Appropriate CI

FR-03: Service and Service Offering Management

The solution shall contain a service hierarchy consisting of:

Remote Access → Corporate VPN

The service and service offering shall be associated with incidents to improve service-level visibility and tracking.

FR-04: Knowledge Integration

The system shall provide relevant knowledge articles through Agent Assist.

Agents should be able to:

- View relevant knowledge articles.
- Open an article.

- Mark an article as helpful.
- Attach an article to the incident.
- Add comments while attaching the article.

FR-05: Incident Reassignment

The system shall support reassignment of incidents to appropriate support groups.

For the demonstration scenario, an incident initially assigned to **Service Desk** shall be reassigned to the **Network** team.

FR-06: Level 2 Investigation

Level 2 support users shall be able to access the incident, review its information, view knowledge articles, and monitor SLA information.

FR-07: Change Management Integration

The incident lifecycle shall support the handling of changes required to resolve an incident.

The incident may be placed **On Hold** with the reason:

Awaiting Change

The associated change activity should be traceable from the incident.

FR-08: Child Incident Management

The system shall allow users to create child incidents from a parent incident when multiple users experience the same or related problem.

The child incident shall remain associated with the parent incident.

FR-09: Incident Resolution

The system shall allow support personnel to document:

- Probable cause
- Resolution code
- Resolution notes

The incident shall then be moved to the **Resolved** state.

FR-10: Knowledge Creation

The system shall allow a knowledge article to be created from a resolved incident.

The article shall be created using the appropriate Knowledge Base and template.

FR-11: SLA Tracking

The system shall display SLA information associated with the incident and allow support personnel to monitor SLA progress.

FR-12: Related Record Tracking

The system shall provide visibility into related records such as:

- Child incidents
- Change requests
- Task SLAs

- Knowledge articles
- Other incident-related records

2.2 Non-Functional Requirements

Performance

The system should provide normal ServiceNow response times while users create, update, and access incident records.

Usability

The incident management process should be understandable to Service Desk and technical support users.

Maintainability

The configuration should follow ServiceNow's standard platform capabilities wherever possible, making the solution easier to maintain and extend.

Scalability

The design should allow additional services, service offerings, support groups, knowledge articles, and incident scenarios to be incorporated later.

Traceability

Important activities throughout the incident lifecycle should remain visible through incident activity and related records.

2.3 User Roles

User/Stakeholder	**Responsibility**
End User	Reports IT issues
Service Desk Agent	Creates, classifies, and initially manages incidents
Level 2 Support	Investigates and resolves technical incidents
Network Team	Handles network/VPN-related incidents
Change Management Team	Handles emergency or required changes
ServiceNow Administrator	Maintains configuration and platform setup

2.4 Primary Use Case

Use Case: Resolve Corporate VPN Authentication Failure

Actor: Service Desk Agent / Level 2 Network Technician

Initial Condition: User cannot connect to Corporate VPN.

Process:

1. Create an incident.
2. Record the caller and issue.

3. Assign the incident to Service Desk.
4. Classify the incident as Network/VPN.
5. Associate Remote Access and Corporate VPN.
6. Use Agent Assist to locate troubleshooting knowledge.
7. Attach relevant knowledge to the incident.
8. Reassign the incident to Network.
9. Level 2 technician investigates the issue.
10. Handle any required change.
11. Create a child incident if another user reports the same issue.
12. Record probable cause.
13. Record resolution details.
14. Resolve the incident.
15. Create a knowledge article.
16. Validate all related records and SLA information.

2.5 Acceptance Criteria

The project will be considered functionally complete when:

- An incident can be created successfully.
- Required incident information can be recorded.
- The incident can be classified.
- Remote Access and Corporate VPN can be associated with the incident.
- Knowledge articles can be accessed through Agent Assist.
- A knowledge article can be attached to the incident.
- The incident can be reassigned to the Network team.
- Level 2 users can investigate the incident.
- SLA information is visible.
- A child incident can be created and linked.
- Change-related activity can be associated with the incident.
- Cause and resolution details can be documented.
- The incident can be resolved.
- A knowledge article can be generated from the incident.
- Parent, child, change, knowledge, and SLA records can be validated.
